Lighthouse Chrome Dev Tool

Pros	Cons
• Built-in & Free: It is conveniently integrated into Chrome DevTools, requires no installation, and is completely free. • Comprehensive Auditing: Offers a holistic view of a page by evaluating multiple categories: Performance, Accessibility, SEO, Best Practices, and Progressive Web Apps (PWA). • Mobile & Desktop Simulation: Allows testing on both desktop and throttled mobile environments to better understand user experience. • Industry Standard: Since it is developed by Google, it is often seen as a baseline for understanding how Google measures site quality.	• Lighthouse runs “lab” tests that simulate specific, controlled conditions. • These results can differ from actual user experience data (Field Data) captured in the Chrome User Experience Report (CrUX). • Running the same audit multiple times can yield different scores due to variations in local CPU, browser extensions, and network conditions. • Lighthouse only catches a subset of potential accessibility issues (roughly 20-50%). • A 100% score does not mean a site is fully accessible or WCAG compliant.
